Cost-Effective Entrance Control For Retail

Retail Mechanical Gate

Effective entrance control in retail can deliver tangible benefits in the safety and security of staff and stock. It helps prevent theft, acting as a visual deterrent, and support controlling the flow of people at entrances and within internal areas.

Mechanical Gates from Gunnebo Entrance Control are an economical alternative to automatic gates designed for access control and customer guidance in retail outlets. It is also a valuable and cost-effective entrance solution used for disabled and trolley access or exists in security installations alongside tripod turnstiles or other products.

While providing effective security for a retail space, the Mechanical Gate is equipped with an anti panic device for customer safety: pushing over a due force the swing gate disengages to create a free exit in both directions.
